MECH 6313 - Homework 1

Jonas Wagner

2021, February 1

1 Problem 1

Problem: Let

$$\dot{x}_1 = -x + x_2$$

$$\dot{x}_2 = \frac{x_1^2}{1 + x_1^2} - 0.5x_2$$
(1)

Define an shifted system, linerize that system, and find the center manifold to analyze the stability properties. Then use numerical simulation to plot the phase portrait of the original coordinates and superimpose the shifted center manifold.

Solution:

1.1 Part a

Let a shifted set of state variables be defined as $\bar{x}_1 = x_1 - 1$ and $\bar{x}_2 = x_2 - 1$. The state variable equation can then be rewritten as

$$kkk$$
 (2)

2 Problem 2 - S 3.7.3

Problem: A simple model of a fishery is given as

$$\dot{N} = rN(1 - \frac{N}{K}) - H \tag{3}$$

where N represents the fish population, H > 0 is the number of fish harvested at a constant rate, and both r and K are constants.

Redefine the model in terms of x, τ , and h. Then plot the vector field for various values of h. Then identify h_c and classify and discuss the bifurcation.

Solution:

2.1 Part a

Let x = N/K, this can then be substituted as

$$\dot{N} = \frac{\mathrm{d}N}{\mathrm{d}t} = \frac{\mathrm{d}x}{\mathrm{d}t} = r(Kx)(1-x) - H \tag{4}$$

$$\frac{1}{rK}\frac{\mathrm{d}x}{\mathrm{d}t} = x(1-x) - \frac{H}{rK} \tag{5}$$

Let $h = \frac{H}{rK}$ and $\tau = rKt$,

$$\frac{\mathrm{d}x}{\mathrm{d}\tau} = x(1-x) - h \tag{6}$$

2.2 Part b

Plotting in matlab

2.3 Part c

As is evident by observing the vector fields shown in ??, and the bifurcation diagram in ??, there exists an h_c where the bifurcation occurs.

2.4 Part d

The long time behavior of this model

3 Problem 3 - S 3.7.4

Problem: An improved model of a fishery is given as

$$\dot{N} = rN(1 - \frac{N}{K}) - H\frac{N}{A+N} \tag{7}$$

where N represents the fish population, H > 0 is the number of fish harvested at a constant rate, and both r, K, A are constants.

Define the biological interpretation of the parameter A. Redefine the model in terms of x, τ , and h. Find and analyze various fixed points depending on the values of a and h. Then analyze the bifurcation that occurs when h = a. Then find and classify the other bifurcation that occurs at $h = \frac{1}{4}(a+1)^2$ for $a < a_c$. Finally plot the stability diagram for the system for (a, h).

Solution:

3.1 Part a

When a population of fish is being fished, there is a portion of fish that are not possible to catch (such as eggs or fish that are too old).

3.2 Part b

Let x = N/K, this can then be substituted as

$$\dot{N} = \frac{\mathrm{d}N}{\mathrm{d}t} = \frac{\mathrm{d}x}{\mathrm{d}t} = r(Kx)(1-x) - H\frac{Kx}{A+Kx} \tag{8}$$

$$\frac{1}{rK}\frac{\mathrm{d}x}{\mathrm{d}t} = x(1-x) - \frac{H}{rK}\frac{Kx}{A+Kx} \tag{9}$$

$$=x(1-x)-\frac{H}{rK}\frac{Kx}{K(\frac{A}{K}+x)}$$
(10)

$$=x(1-x)-\frac{H}{rK}\frac{x}{\frac{A}{K}+x}\tag{11}$$

Let $h = \frac{H}{rK}$, $\tau = rKt$, and $a = \frac{A}{K}$

$$\frac{\mathrm{d}x}{\mathrm{d}\tau} = x(1-x) - h\frac{x}{a+x} \tag{12}$$

3.3 Part c

4 Problem 4 - K 3.8

Problem: Let the following system be defined:

$$\dot{x}_1 = -x_1 + \frac{2x_2}{1 + x_2^2}, \ x_1(0) = a$$

$$\dot{x}_2 = -x_2 + \frac{2x_1}{1 + x_1^2}, \ x_2(0) = b$$
(13)

Show that this system has a unique solution for all $t \geq 0$.

Solution:

The system is known to be continuous on its domain. It is also apparent that both functions are differentiable, which results in a Jacobian of

$$\begin{bmatrix} -1 & \frac{2}{x_2^2 + 1} - \frac{4x_2^2}{(x_2^2 + 1)^2} \\ \frac{2}{x_1^2 + 1} - \frac{4x_1^2}{(x_1^2 + 1)^2} & -1 \end{bmatrix}$$
 (14)

which indicates the systems dynamics are both differentiable and differential bounded. This also implies that the system is globbaly Lipshitz continuous, therefore a unique solution exists for $t \ge 0$.

5 Problem 5 - K 3.13

Problem: Let the following system be defined:

$$\dot{x}_1 = \tan^{-1}(ax_1) - x_1 x_2$$

$$\dot{x}_2 = bx_1^2 - cx_2$$
(15)

Derive the sensitivity equations for the parameters vary from their nominal values of $a_0 = 1$, $b_0 = 0$, and $c_0 = 1$. Then simulate the sensitivity equations and the time dependence for the initial conditions of $(x_1(0), x_2(0)) = (1, -1)$.

Solution:

A MATLAB Code:

All code I write in this course can be found on my GitHub repository: https://github.com/jonaswagner2826/MECH6313
